

SYSTOC vs. Generic EMRs

Occupational health clinics operate a different clinical and business model than primary care. Your customers are employers. Your billing flows to multiple accounts. Your relationships depend on giving the right people the right information. A general EMR was not built for any of that. SYSTOC is.

Generic EMR

Staff adapt every visit and note to templates built for primary care.

Providers scroll through endless dropdowns of irrelevant options.

Billing multiple employer accounts manually leads to errors, delays, and slower payments.

Workers' comp billing has no purpose-built logic for occ health complexity.

Employers call the clinic for every worker status update.

Sharing worker information requires manual review to avoid disclosing protected details.

SYSTOC

Purpose-built workflows for DOT physicals, drug screenings, and return-to-work exams.

Configurable, occ health-specific lists keep the focus where it belongs: on the patient.

Automated employer billing routes invoices to the right account with the right coding.

Automated workers' comp billing means fewer errors and faster collections.

The employer portal gives employers direct access to fitness-for-duty status.

Built-in privacy controls ensure employers see only what they need.

If you are working around your software, you have the wrong software. SYSTOC is purpose-built occupational health clinic management. EMR, employer billing, and employer portal in one solution.
